Part I

Introduction

intro

Chapter 1

Data representation

The data structures we're going to use is *Point* and *Image*. *Image* represents a bitmap, although we will use full RGB colors for our points therefore the size of a pixel in memory will be u8 instead of l bit.

We will work on the cartesian grid representing the framebuffer that will show us the pixels. The *origin* of this grid (i.e. the center) is at $(0,0)$.

We will represent points as pairs of signed integers. When actually drawing them though, negative values and values outside the window's geometry will be

src/lib.rs: ignored (clipped).

This code file is a PDF attachment

intro

```
pub type Point = (i64, i64);

pub const fn from_u8_rgb(r: u8, g: u8, b: u8) -> u32 {
    let (r, g, b) = (r as u32, g as u32, b as u32);
    (r << 16) | (g << 8) | b
}

pub const AZURE_BLUE: u32 = from_u8_rgb(0, 127, 255);
pub const RED: u32 = from_u8_rgb(157, 37, 10);
pub const WHITE: u32 = from_u8_rgb(255, 255, 255);
pub const BLACK: u32 = 0;

pub struct Image {
    pub bytes: Vec<u32>,
    pub width: usize,
    pub height: usize,
    pub x_offset: usize,
    pub y_offset: usize,
}

impl Image {
    pub fn new(width: usize, height: usize, x_offset: usize, y_offset: usize) -> Self;
    pub fn from_xbm(path: &str, x_offset: usize, y_offset: usize) -> Result<Self, Box<dyn
↳ Error>>>;
    pub fn draw(&self, buffer: &mut Vec<u32>, fg: u32, bg: Option<u32>, window_width:
↳ usize);
    pub fn draw_outline(&mut self);
    pub fn clear(&mut self);
    pub fn plot(&mut self, x: i64, y: i64);
    pub fn get(&mut self, x: i64, y: i64) -> u32;
    pub fn plot_ellipse(
        &mut self,
        (xm, ym): (i64, i64),
        (a, b): (i64, i64),
        quadrants: [bool; 4],
        _wd: f64,
    );
    pub fn plot_line_width(&mut self, point_a: Point, point_b: Point, wd: f64);
    pub fn flood_fill(&mut self, mut x: i64, y: i64);
}
```

Chapter 2

Displaying pixels to your screen

A way to display an *Image* is to use the `minifb` crate which allows you to create a window and draw pixels directly on it. Here's how you could set it up:

`src/bin/introduction.rs`

This code file is a PDF attachment

```
use bitmappers_companion::*;
use minifb::{Key, Window, WindowOptions};

const WINDOW_WIDTH: usize = 400;
const WINDOW_HEIGHT: usize = 400;

fn main() {
    let mut buffer: Vec<u32> = vec![WHITE; WINDOW_WIDTH * WINDOW_HEIGHT];
    let mut window = Window::new(
        "Test - ESC to exit",
        WINDOW_WIDTH,
        WINDOW_HEIGHT,
        WindowOptions {
            title: true,
            //borderless: true,
            //resize: false,
            //transparency: true,
            ..WindowOptions::default()
        },
    )
    .unwrap();

    // Limit to max ~60 fps update rate
    window.limit_update_rate(Some(std::time::Duration::from_micros(16600)));

    let mut image = Image::new(50, 50, 150, 150);
    image.draw_outline();
    image.draw(&mut buffer, BLACK, None, WINDOW_WIDTH);

    while window.is_open()
        && !window.is_key_down(Key::Escape)
        && !window.is_key_down(Key::Q) {
        window
            .update_with_buffer(&buffer, WINDOW_WIDTH, WINDOW_HEIGHT)
            .unwrap();
        let millis = std::time::Duration::from_millis(100);
        std::thread::sleep(millis);
    }
}
```

Running this will show you something like this:

intro

Chapter 3

Bits to byte pixels

Let's define a way to convert bit information to a byte vector:

```
pub fn bits_to_bytes(bits: &[u8], width: usize) -> Vec<u32> {  
    let mut ret = Vec::with_capacity(bits.len() * 8);  
    let mut current_row_count = 0;  
    for byte in bits {  
        for n in 0..8 {  
            if byte.rotate_right(n) & 0x01 > 0 {  
                ret.push(BLACK);  
            } else {  
                ret.push(WHITE);  
            }  
            current_row_count += 1;  
            if current_row_count == width {  
                current_row_count = 0;  
                break;  
            }  
        }  
    }  
    ret  
}
```

intro

Chapter 4

Loading graphics files in Rust

The book's library includes a method to load `xbm` files on runtime (see *Including `xbm` files in **Rust*** for including them in your binary at compile time). If you have another way to load pictures such as your own code or a picture format library crate, all you have to do is convert the pixel information to an `Image` whose definition we repeat here:

```
pub struct Image {  
    pub bytes: Vec<u32>,  
    pub width: usize,  
    pub height: usize,  
    pub x_offset: usize,  
    pub y_offset: usize,  
}
```

intro

Chapter 5

Including xbm files in Rust

*The end of this chapter includes a short **Rust** program to automatically convert **xbm** files to equivalent **Rust** code.*

xbm files are C source code files that contain the pixel information for an image as macro definitions for the dimensions and a static char array for the pixels, with each bit column representing a pixel. If the width dimension doesn't have 8 as a factor, the remaining bit columns are left blank/ignored.

They used to be a popular way to share user avatars in the old internet and are also good material for us to work with, since they are small and numerous. The following is such an image:

Then, we can convert the xbm file from C to **Rust** with the following transformations:

```
#define news_width 48  
#define news_height 48  
static char news_bits[] = {
```

to

```
const NEWS_WIDTH: usize = 48;  
const NEWS_HEIGHT: usize = 48;  
const NEWS_BITS: &[u8] = &[
```

And replace the closing `}` with `]`.

We can then include the new file in our source code:

```
include!("news.xbm.rs");
```

load the image:

```
let mut image = Image::new(NEWS_WIDTH, NEWS_HEIGHT, 25, 25);  
image.bytes = bits_to_bytes(NEWS_BITS, NEWS_WIDTH);
```

and finally run it:

The following short program uses the regex crate to match on these simple rules and print the equivalent code in stdout. You can use it like so:

```
cargo run --bin xbmtools -- file.xbm > file.xbm.rs
```

src/bin/xbmtors.rs:

This code file is a PDF
attachment

```
use regex;  
use regex::Regex;  
use std::fs::File;  
use std::io::prelude::*;  
  
fn main() {  
    let args = std::env::args().skip(1).collect::<Vec<String>>();  
    if args.len() != 1 {  
        println!("one argument expected, the xbm file path to convert.");  
        return;  
    }  
    let mut file = match File::open(&args[0]) {  
        Err(err) => panic!("couldn't open {}: {}", args[0], err),  
        Ok(file) => file,  
    };  
  
    let mut s = String::new();  
    if let Err(err) = file.read_to_string(&mut s) {  
        panic!("couldn't read {}: {}", args[0], err);  
    }  
  
    let re = Regex::new(  
        r"(?imax)  
^\\s*\\x23\\s*define\\s+(?P<i>.+?)_width\\s+(?P<w>\\d\\d*)$  
")
```

```

    \|s*
    ^\|s*\x23\|s*define\|s*.*?_height\|s*(?P<h>\d\d*)$
    \|s*
    ^\|s*static(\|s*unsigned){0,1}\|s*char\|s*.*?_bits.. \|s*=\|s*\{(?P<b>[~}]+)\};
",
)
.unwrap();
let caps = re
    .captures(&s)
    .expect("Could not convert file, regex doesn't match :(");
let ident = caps.name("i").unwrap().as_str().to_uppercase();
let out = re.replace_all(&s, format!("const {i}_WIDTH: usize = $w;\nconst {i}_HEIGHT:
↪  usize = $h;\nconst {i}_BITS: &[u8] = &[$b];", i = &ident));
println!("{}", out.trim());
}

```

lines

Part II

Points And Lines

lines

Chapter 6

Distance between two points

lines

Given two points, K and L , an elementary application of Pythagoras' Theorem gives the distance between them as

$$r = \sqrt{(x_L - x_K)^2 + (y_L - y_K)^2} \quad (6.1)$$

which is simply coded:

```
pub fn distance_between_two_points(p_k: Point, p_l: Point) -> f64 {  
    let (x_k, y_k) = p_k;  
    let (x_l, y_l) = p_l;  
    let xlk = x_l - x_k;  
    let ylk = y_l - y_k;  
    f64::sqrt((xlk*xlk + ylk*ylk) as f64)  
}
```

lines

Chapter 7

Equations of a line

lines

There are several ways to describe a line mathematically. We'll list the convenient ones for drawing pixels.

The equation that describes every possible line on a two dimensional grid is the *implicit* form $ax + by = c$, $(a, b) \neq (0, 0)$. We can generate equivalent equations by adding the equation to itself, i.e. $ax + by = c \equiv 2ax + 2by = 2c \equiv a'x + b'y = c'$, $a' = 2a, b' = 2b, c' = 2c$ as many times as we want. To "minimize" the constants a, b, c we want to satisfy the relationship $a^2 + b^2 = 1$, and thus can convert the equivalent equations into one representative equation by multiplying the two sides with $\frac{1}{\sqrt{a^2 + b^2}}$; this is called the normalized equation.

The *slope intercept form* describes any line that intercepts the y axis at $b \in \mathbb{R}$ with a specific slope a :

$$y = ax + b$$

The *parametric* form...

7.1 Line through a point $P = (x_p, y_p)$ and a slope m

$$y - y_p = m(x - x_p)$$

7.2 Line through two points

lines

It seems sufficient, given the coordinates of two points M, N , to calculate a, b and c to form a line equation:

$$ax + by + c = 0$$

If the two points are not the same, they necessarily form such a line. To get there, we start from expressing the line as parametric over t : at $t = 0$ it's at point M and at $t = 1$ it's at point N :

$$c = c_M + (c_N - c_M)t, t \in R, c \in \{x, y\}$$

$$c = c_M, t \in R, c \in \{x, y\}$$

Substituting t in one of the equations we get:

$$(y_M - y_N)x + (x_N - x_M)y + (x_M y_N - x_N y_M) = 0$$

Which is what we were after. We finish by normalising what we found with $\frac{1}{\sqrt{a^2 + b^2}}$:

Chapter 8

Distance from a point to a line

lines

Add code samples in *Distance from a point to a line*

8.1 Using the implicit equation form

Let's find the distance from a given point P and a given line L . Let d be the distance between them. Bring L to the implicit form $ax + by = c$.

$$d = \frac{|ax_p + by_p + c|}{\sqrt{a^2 + b^2}}$$

8.2 Using an L defined by two points P_1, P_2

With $P = (x_0, y_0)$, $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$.

$$d = \frac{|(x_2 - x_1)(y_1 - y_0) - (x_1 - x_0)(y_2 - y_1)|}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}}$$

8.3 Using an L defined by a point P_l and angle $\hat{\theta}$

$$d = |\cos(\hat{\theta})(P_{ly} - y_p) - \sin(\hat{\theta})(P_{lx} - P_x)|$$

Chapter 9

Angle between two lines

lines

Add *Angle between two lines* code samples

By angle we mean the angle formed by the two directions of the lines; and direction vectors start from the origin (in the figure, they are the **red arrows**). So if we want any of the other three angles, we already know them from basic geometry as shown in the figure above.

If you prefer using the implicit equation, bring the two lines L_1 and L_2 to that form ($a_1x + b_1y + c = 0$ and $a_2x + b_2y + c_2 = 0$) and you can directly find $\hat{\theta}$ with the formula:

$$\hat{\theta} = \arccos \frac{a_1a_2 + b_1b_2}{\sqrt{(a_1^2 + b_1^2)(a_2^2 + b_2^2)}}$$

For the following parametric equations of L_1, L_2 :

$$L_1 = (\{x = x_1 + f_1 t\}, \{y = y_1 + g_1 t\})$$

$$L_2 = (\{x = x_2 + f_2 s\}, \{y = y_2 + g_2 s\})$$

the formula is:

$$\hat{\theta} = \arccos \frac{f_1 f_2 + g_1 g_2}{\sqrt{(f_1^2 + g_1^2)(f_2^2 + g_2^2)}}$$

lines

Chapter 10

Intersection of two lines

lines

Add *Intersection of two lines* code

If the lines L_1, L_2 are in implicit form ($a_1x + b_1y + c = 0$ and $a_2x + b_2y + c_2 = 0$), the result comes after checking if the lines are parallel (in which case there's no single point of intersection):

$$a_1b_2 - a_2b_1 \neq 0$$

If they are not parallel, P is:

$$P = (\frac{b_1c_2 - b_2c_1}{a_1b_2 - a_2b_1}, \frac{a_2c_1 - a_1c_2}{a_1b_2 - a_2b_1})$$

lines

Chapter 11

Line equidistant from two points

lines

Let's name this line L . From the previous chapter we know how to get the line that's created by the two points M and N . If only we knew how to get a perpendicular line over the midpoint of a line segment!

Thankfully that midpoint also satisfies L 's equation, $ax + by + c$. The midpoint's coordinates are intuitively:

$$\left(\frac{x_M + x_N}{2}, \frac{y_M + y_N}{2}\right)$$

Putting them into the equation we can generate a triple of (a', b', c') and then normalize it to get L .

lines

Chapter 12

Normal to a line through a point

lines

Add *Normal to a line through a point*

1

lines

Part III

Points And Line Segments

segments

segments

Chapter 13

Drawing a line segment from its two endpoints

For any line segment with any slope, pixels must be matched with the infinite amount of points contained in the segment. As shown in the following figure, a segment *touches* some pixels; we could fill them using an algorithm and get a bitmap of the line segment.

The algorithm presented here was first derived by Bresenham. In the *Image* implementation, it is used in the `plot_line_width` method.

```
pub fn plot_line_width(&mut self, (x1, y1): (i64, i64), (x2, y2): (i64, i64)) {  
    /* Bresenham's line algorithm */  
    let mut d;  
    let mut x: i64;  
    let mut y: i64;  
    let ax: i64;  
    let ay: i64;  
    let sx: i64;  
    let sy: i64;  
    let dx: i64;  
    let dy: i64;  
  
    dx = x2 - x1;  
    ax = (dx * 2).abs();  
    sx = if dx > 0 { 1 } else { -1 };  
}
```

segments

```
dy = y2 - y1;
ay = (dy * 2).abs();
sy = if dy > 0 { 1 } else { -1 };
x = x1;
y = y1;

let b = dx / dy;
let a = 1;
let double_d = (_wd * f64::sqrt((a * a + b * b) as f64)) as i64;
let delta = double_d / 2;

if ax > ay {
  d = ay - ax / 2;
  loop {
    self.plot(x, y);
    if x == x2 {
      return;
    }
    if d >= 0 {
      y = y + sy;
      d = d - ax;
    }
    x = x + sx;
    d = d + ay;
  }
} else {
  d = ax - ay / 2;
  let delta = double_d / 3;
  loop {
    self.plot(x, y);
    if y == y2 {
      return;
    }
    if d >= 0 {
      x = x + sx;
      d = d - ay;
    }
    y = y + sy;
    d = d + ax;
  }
}
```

Add some explanation behind the algorithm in *Drawing a line segment from its two endpoints*

Chapter 14

Drawing line segments with width

```
pub fn plot_line_width(&mut self, (x1, y1): (i64, i64), (x2, y2): (i64, i64), _wd: f64) {  
    /* Bresenham's line algorithm */  
    let mut d;  
    let mut x: i64;  
    let mut y: i64;  
    let ax: i64;  
    let ay: i64;  
    let sx: i64;  
    let sy: i64;  
    let dx: i64;  
    let dy: i64;  
  
    dx = x2 - x1;  
    ax = (dx * 2).abs();  
    sx = if dx > 0 { 1 } else { -1 };  
  
    dy = y2 - y1;  
    ay = (dy * 2).abs();  
    sy = if dy > 0 { 1 } else { -1 };  
  
    x = x1;  
    y = y1;  
  
    let b = dx / dy;  
    let a = 1;  
    let double_d = (_wd * f64::sqrt((a * a + b * b) as f64)) as i64;  
    let delta = double_d / 2;  
  
    if ax > ay {  
        d = ay - ax / 2;  
        loop {  
            self.plot(x, y);  
            {  
                let total = |_x| _x - (y * dx) / dy + (y1 * dx) / dy - x1;  
                let mut _x = x;  
                loop {  
                    let t = total(_x);  
                    if t < -1 * delta || t > delta {  
                        break;  
                    }  
                    _x += 1;  
                    self.plot(_x, y);  
                }  
                let mut _x = x;  
                loop {  
                    let t = total(_x);  
                    if t < -1 * delta || t > delta {  
                        break;  
                    }

    if d >= 0 {
        x = x + sx;
        d = d - ay;
    }
    y = y + sy;
    d = d + ax;
}
}
```

Chapter 15

Intersection of two line segments

Let points **1** = (x_1, y_1) , **2** = (x_2, y_2) , **3** = (x_3, y_3) and **4** = (x_4, y_4) and **1,2**, **3,4** two line segments they form. We wish to find their intersection:

First, get the equation of line L_{12} and line L_{34} from chapter *Equations of a line*.

Substitute points **3** and **4** in equation L_{12} to compute $r_3 = L_{12}(\mathbf{3})$ and $r_4 = L_{12}(\mathbf{4})$ respectively.

If $r_3 \neq 0$, $r_4 \neq 0$ and $\text{sgn}(r_3) == \text{sign}(r_4)$ the line segments don't intersect, so stop.

In L_{34} substitute point **1** to compute r_1 , and do the same for point **2**.

If $r_1 \neq 0$, $r_2 \neq 0$ and $\text{sgn}(r_1) == \text{sign}(r_2)$ the line segments don't intersect, so stop.

At this point, L_{12} and L_{34} either intersect or are equivalent. Find their intersection point. (Refer to *Intersection of two lines*.)

Bounding circle

src/bin/boundingcircle.rs:

This code file is a PDF attachment

circles

A bounding circle is a circle that includes all the points in a given set. Usually we're interested in one of the smallest ones possible.

We can use the following methodology to find the bounding circle: start from two points and the circle they make up, and for each of the rest of the points check if the circle includes them. If not, make a bounding circle that includes every point up to the current one. To do this, we need some primitive operations.

We will need a way to construct a circle out of two points:

```
let p1 = points[0];
let p2 = points[1];
//The circle is determined by two points, P and Q. The center of the circle
↪ is
//at (P + Q)/2.0 and the radius is |(P - Q)/2.0|
let d_2 = (
  ((p1.0 + p2.0) / 2), (p1.1 + p2.1) / 2),
  (distance_between_two_points(p1, p2) / 2.0),
);
```

And a way to make a circle out of three points:

```
fn min_circle_w_3_points(q1: Point, q2: Point, q3: Point) -> Circle {
  let (ax, ay) = (q1.0 as f64, q1.1 as f64);
  let (bx, by) = (q2.0 as f64, q2.1 as f64);
  let (cx, cy) = (q3.0 as f64, q3.1 as f64);

  let mut d = 2. * (ax * (by - cy) + bx * (cy - ay) + cx * (ay - by));
  if d == 0.0 {
    d = std::cmp::max(
      std::cmp::max(
        distance_between_two_points(q1, q2) as i64,
        distance_between_two_points(q2, q3) as i64,
      ),
      distance_between_two_points(q1, q3) as i64,
    ) as f64
  }
  / 2.;
}
let ux = ((ax * ax + ay * ay) * (by - cy)
  + (bx * bx + by * by) * (cy - ay)
  + (cx * cx + cy * cy) * (ay - by))
  / d;
let uy = ((ax * ax + ay * ay) * (cx - bx)
```

```

    + (bx * bx + by * by) * (ax - cx)
    + (cx * cx + cy * cy) * (bx - ax))
    / d;
let mut center = (ux as i64, uy as i64);
if center.0 < 0 {
    center.0 = 0;
}
if center.1 < 0 {
    center.1 = 0;
}
let d = distance_between_two_points(center, q1);
(center, d)
}

```

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes the need for transparency and accountability in financial reporting.

2. The second part of the document focuses on the role of the board of directors in overseeing the company's financial health and ensuring compliance with applicable laws and regulations. It highlights the importance of regular communication and reporting between the board and management.

3. The third part of the document addresses the challenges faced by the company in managing its financial resources and maintaining a strong credit rating. It outlines the strategies implemented to address these challenges and the progress made in improving the company's financial performance.

Part VII

Vectors, matrices and transformations

Chapter 24

Rotation of a bitmap

$$p' = \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} x_p \\ y_p \end{bmatrix}$$

$$c = \cos\theta, s = \sin\theta, x_{p'} = x_p c - y_p s, y_{p'} = x_p s + y_p c.$$

Let's load an xface. We will use `bits_to_bytes` (See Introduction).

```
include!("dmr.rs");
const WINDOW_WIDTH: usize = 100;
const WINDOW_HEIGHT: usize = 100;
let mut image = Image::new(DMR_WIDTH, DMR_HEIGHT, 25, 25);
image.bytes = bits_to_bytes(DMR_BITS, DMR_WIDTH);
```

src/bin/rotation.rs:

This code file is a PDF attachment

This is the xface of dmr. Instead of displaying the bitmap, this time we will rotate it 0.5 radians. Setup our image first:

trans-
forma-
tions

```
let mut image = Image::new(DMR_WIDTH, DMR_HEIGHT, 25, 25);
image.draw_outline();
let dmr = bits_to_bytes(DMR_BITS, DMR_WIDTH);
```

And then, loop for each byte in dmr's face and apply the rotation transformation.

```
let angle = 0.5;
let c = f64::cos(angle);
let s = f64::sin(angle);
for y in 0..DMR_HEIGHT {
    for x in 0..DMR_WIDTH {
        if dmr[y * DMR_WIDTH + x] == BLACK {
            let x = x as f64;
            let y = y as f64;
            let xr = x * c - y * s;
            let yr = x * s + y * c;
            image.plot(xr as i64, yr as i64);
        }
    }
}
```

The result:

We didn't mention in the beginning that the rotation has to be relative to a *point* and the given transformation is relative to the *origin*, in this case the upper left corner (0,0). So dmr was rotated relative to the origin:

(the distance to the origin (actually 0 pixels) has been exaggerated for the sake of the example)

Usually, we want to rotate something relative to itself. The right point to choose is the *centroid* of the object.

If we have a list of n points, the centroid is calculated as:

$$x_c = \frac{1}{n} \sum_{i=0}^n x_i$$

$$y_c = \frac{1}{n} \sum_{i=0}^n y_i$$

Since in this case we have a rectangle, the centroid has coordinates of half the width and half the height.

By subtracting the centroid from each point before we apply the transformation and then adding it back after we get what we want:

Here's it visually: First subtract the center point.

Then, rotate.

And subtract back to the original position.

In code:

```
let center_point = ((DMR_WIDTH/2) as i64, (DMR_HEIGHT/2) as i64);
for y in 0..DMR_HEIGHT {
  for x in 0..DMR_WIDTH {
    if dmr[y * DMR_WIDTH + x] == BLACK {
      let x = (x as i64 - center_point.0) as f64;
      let y = (y as i64 - center_point.1) as f64;
      let xr = x * c - y * s;
      let yr = x * s + y * c;
      image.plot(xr as i64 + center_point.0,
                 yr as i64 + center_point.1);
    }
  }
}
```

Chapter 26

Magnification/Scaling

We want to magnify a bitmap without any smoothing. We define an Image scaled to the dimensions we want, and loop for every pixel in the scaled Image. Then, for each pixel, calculate its source in the original bitmap: if the coordinates in the scaled bitmap are (x, y) then the source coordinates (sx, sy) are:

$$sx = \frac{x * original.width}{scaled.width}$$
$$sy = \frac{y * original.height}{scaled.height}$$

So, if (sx, sy) are painted, then (x, y) must be painted as well.

src/bin/scale.rs:

This code file is a PDF attachment

```
let mut original = Image::new(DMR_WIDTH, DMR_HEIGHT, 25, 25);
original.bytes = bits_to_bytes(DMR_BITS, DMR_WIDTH);
original.draw(&mut buffer, BLACK, None, WINDOW_WIDTH);

let mut scaled = Image::new(DMR_WIDTH * 5, DMR_HEIGHT * 5, 100, 100);
let mut sx: i64; //source
let mut sy: i64; //source
let mut dx: i64; //destination
let mut dy: i64 = 0; //destination

let og_height = original.height as i64;
let og_width = original.width as i64;
let scaled_height = scaled.height as i64;
let scaled_width = scaled.width as i64;

while dy < scaled_height {
    sy = (dy * og_height) / scaled_height;
    dx = 0;
    while dx < scaled_width {
        sx = (dx * og_width) / scaled_width;
        if original.get(sx, sy) == Some(BLACK) {
            scaled.plot(dx, dy);
        }
        dx += 1;
    }
    dy += 1;
}
scaled.draw(&mut buffer, BLACK, None, WINDOW_WIDTH);
```

Chapter 27

Mirroring

Add screenshots and figure and code in *Mirroring*

Mirroring to an axis is the transformation of one coordinate to its equidistant value across the axis:

To mirror a pixel across the x axis, simply multiply its coordinates with the following matrix:

$$M_x = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$$

This results in the y coordinate's sign being flipped.

For y -mirroring, the transformation follows the same logic:

$$M_y = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$$

Chapter 28

Shearing

Simple shearing is the transformation of one dimension by a distance proportional to the other dimension, In x -shearing (or horizontal shearing) only the x coordinate is affected, and likewise in y -shearing only y as well.

src/bin/shearing.rs:

This code file is a PDF attachment

With l being equal to the desired tilt away from the y axis, the transformation is described by the following matrix:

$$S_x = \begin{bmatrix} 1 & l \\ 0 & 1 \end{bmatrix}$$

Which is as simple as this function:

```
fn shear_x((x_p, y_p): (i64, i64), l: f64) -> (i64, i64) {  
    (x_p + (l * (y_p as f64)) as i64, y_p)  
}
```

trans-
forma-
tions

For y -shearing, we have the following:

$$S_y = \begin{bmatrix} 1 & 0 \\ l & 1 \end{bmatrix}$$

```
fn shear_y((x_p, y_p): (i64, i64), l: f64) -> (i64, i64) {
    (x_p, (l*(x_p as f64)) as i64 + y_p)
}
```

A full example:

```
include!("../dmr.xbm.rs");
const WINDOW_WIDTH: usize = 200;
const WINDOW_HEIGHT: usize = 200;

fn shear_x((x_p, y_p): (i64, i64), l: f64) -> (i64, i64) {
    (x_p+(l*(y_p as f64)) as i64, y_p)
}
fn shear_y((x_p, y_p): (i64, i64), l: f64) -> (i64, i64) {
    (x_p, (l*(x_p as f64)) as i64 + y_p)
}

let mut image = Image::new(DMR_WIDTH, DMR_HEIGHT, 25, 25);
image.bytes = bits_to_bytes(DMR_BITS, DMR_WIDTH);
image.draw_outline();
```

```

let l = -0.5;
let mut sheared = Image::new(DMR_WIDTH*2, DMR_HEIGHT*2, 25, 25);
for x in 0..DMR_WIDTH {
  for y in 0..DMR_HEIGHT {
    if image.bytes[y * DMR_WIDTH + x] == BLACK {
      let p = shear_x((x as i64 ,y as i64 ), l);
      sheared.plot(p.0+(DMR_WIDTH/2) as i64, p.1+(DMR_HEIGHT/2) as i64);
    }
  }
}
sheared.draw_outline();

```

28.1 The relationship between shearing factor and angle

Shearing is a delta movement in one dimension, thus the point before moving and the point after form an angle with the x axis. To move a point $(x, 0)$ by 30° forward we will have the new point $(x + f, 0)$ where f is the shear factor. These two points and (x, h) where h is the height of the bitmap form a triangle, thus the following are true:

$$\cot\theta = \frac{h}{f}$$

Therefore to find your factor for any angle θ replace its cotangent in the following formula:

$$f = \frac{h}{\cot\theta}$$

For example to shear by -30° (meaning the bitmap will move to the right, since rotations are always clockwise) we need $\cot(-30deg) = -\sqrt{3}$ and $f = -\frac{h}{\sqrt{3}}$.

35.1 Hilbert curve

Add Hilbert curve explanation

The first six iterations of the Hilbert curve by [Braindrain0000](#)

Here's a simple algorithm for drawing a Hilbert curve.¹

```
const HILBERT: &[&[usize]] = &[
    &[22, 10, 16, 38],
    &[10, 22, 24, 48],
    &[44, 36, 30, 18],
    &[36, 44, 42, 28],
];

fn curve(img: &mut Image, k: usize, order: i64, mut x: i64, mut y: i64) -> (i64, i64) {
    const STEP_SIZE: i64 = 5;
    let mut row: usize;
    let mut direction: usize;
    if order > 0 {
        for j in 0..4 {
            let step = HILBERT[k][j];
            row = (step / 10) - 1;
            let (xn, yn) = curve(img, row, order - 1, x, y);
            x = xn;
            y = yn;
            direction = step % 10;
            let prev = (x, y);
            match direction {
                8 => {
                    // null op
                }
                2 => {
                    // N
                    y -= STEP_SIZE;
                }
                1 => {

```

src/bin/hilbert.rs¹

¹Griffiths, J. G. (1985). *Table-driven algorithms for generating space-filling curves*. Computer-Aided Design, 17(1), 37–41. doi:10.1016/0010-4485(85)90009-0

```

        // NE
        y -= STEP_SIZE;
        x += STEP_SIZE;
    }
    0 => {
        // E
        x += STEP_SIZE;
    }
    7 => {
        // SE
        x += STEP_SIZE;
        y += STEP_SIZE;
    }
    6 => {
        // S
        y += STEP_SIZE;
    }
    5 => {
        // SW
        y += STEP_SIZE;
        x -= STEP_SIZE;
    }
    4 => {
        // W
        x -= STEP_SIZE;
    }
    3 => {
        // NW
        y -= STEP_SIZE;
        x -= STEP_SIZE;
    }
    other => unreachable!("{}", other),
}
img.plot_line_width(prev, (x, y), 0.);
}
}
(x, y)
}

```

```

let mut image = Image::new(WINDOW_WIDTH, WINDOW_WIDTH, 0, 0);
curve(&mut image, 0, 7, 0, WINDOW_WIDTH as i64);

```

35.2 Sierpiński curve

Switching the table from the Hilbert implementation to this:

```
const SIERP: &[[usize]] = &[
    &[17, 25, 33, 41],
    &[17, 20, 41, 18],
    &[25, 36, 17, 28],
    &[33, 44, 25, 38],
    &[41, 12, 33, 48],
];
```

And switching two lines from the function to

```
- let step = HILBERT[k][j];
- row = (step / 10) - 1;
+ let step = SIERP[k][j];
+ row = (step / 10);
```

You can draw a Sierpinshi curve of order n by calling `curve(&mut image, 0, n+1, 0, 0)`.

35.3 Peano curve

Add Peano curve

35.4 Z-order curve

Drawing the Z-order curve is really simple: first, have a counter variable that starts from zero and is incremented by one at each step. Then, you extract the (x, y) coordinates the new step represents from its binary representation. The bits for the x coordinate are located at the odd bits, and for y at the even bits. I.e. the values are interleaved as bits in the value of the step:

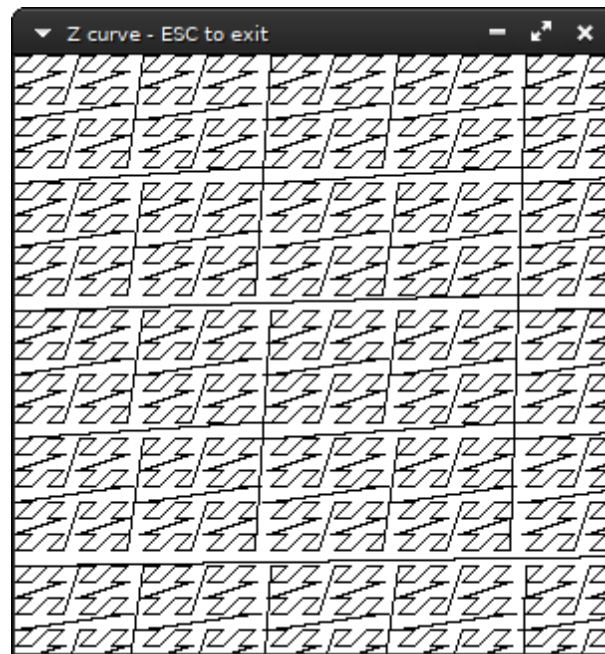

Knowing this, implementing the drawing process will consist of computing the next step, drawing a line segment from the current step and the next, set the current step as the next and continue;

```
fn zcurve(img: &mut Image, x_offset: i64, y_offset: i64) {
    const STEP_SIZE: i64 = 8;
    let mut sx: i64 = 0;
    let mut sy: i64 = 0;
    let mut b: u64 = 0;
    let mut prev_pos = (sx + x_offset, sy + y_offset);
    loop {
        let next = b + 1;
        sx = 0;
        if (next & 1) as i64 > 0 {
            sx += STEP_SIZE;
        }
        if next & 0b100 > 0 {
            sx += 2 * STEP_SIZE;
        }
        if next & 0b10_000 > 0 {
            sx += 4 * STEP_SIZE;
        }
        if next & 0b1_000_000 > 0 {
            sx += 8 * STEP_SIZE;
        }
        if next & 0b100_000_000 > 0 {
            sx += 16 * STEP_SIZE;
        }
        if next & 0b10_000_000_000 > 0 {
            sx += 32 * STEP_SIZE;
        }
        if next & 0b1_000_000_000_000 > 0 {
            sx += 64 * STEP_SIZE;
        }
        if next & 0b100_000_000_000_000 > 0 {
            sx += 128 * STEP_SIZE;
        }
    }
}
```

```

    }
    if next & 0b10_000_000_000_000_000 > 0 {
        sx += 256 * STEP_SIZE;
    }
    if next & 0b1_000_000_000_000_000_000 > 0 {
        sx += 512 * STEP_SIZE;
    }
    sy = 0;
    if (next & 0b10) as i64 > 0 {
        sy += STEP_SIZE;
    }

        sy += 2 * STEP_SIZE;
    }
    if next & 0b100_000 > 0 {
        sy += 4 * STEP_SIZE;
    }
    if next & 0b10_000_000 > 0 {
        sy += 8 * STEP_SIZE;
    }
    if next & 0b1_000_000_000 > 0 {
        sy += 16 * STEP_SIZE;
    }
    if next & 0b100_000_000_000 > 0 {
        sy += 32 * STEP_SIZE;
    }
    if next & 0b10_000_000_000_000 > 0 {
        sy += 64 * STEP_SIZE;
    }
    if next & 0b1_000_000_000_000_000 > 0 {
        sy += 128 * STEP_SIZE;
    }
    if next & 0b100_000_000_000_000_000 > 0 {
        sy += 256 * STEP_SIZE;
    }
    if next & 0b10_000_000_000_000_000_000 > 0 {
        sy += 512 * STEP_SIZE;
    }
    img.plot_line_width(prev_pos, (sx + x_offset, sy + y_offset), 1.0);
    if next == 0b111_111_111_111_111_111_111 {
        break;
    }
    if sx as usize > img.width && sy as usize > img.height {
        break;
    }
    prev_pos = (sx + x_offset, sy + y_offset);
    b = next;
}
}
